```
satisfied else return -1. Assume there is no repetition of any vowel in
                     the given string and all letters are in lower case.
                     Include a class UserMainCode with a static method testOrderVowels which
                     accepts a string The return type is integer based on the condition stated
import java.util.LinkedHashMap;
import java.util.Scanner;
public class Question_1 {
          public static void main(String[] args) {
                     Scanner scan=new Scanner(System.in);
                     UserMainCode umc=new UserMainCode();
                     String a=scan.next();
                     int ansi=umc.vowels(a);
                     if(ans1==1) {
                                System.out.println("Valid");
                     }
                     else {
                                System.out.println("Invalid");
                     String b=scan.next();
                     int ans2=umc.vowels(b);
                     if(ans2==1) {
                                System.out.println("Valid");
                     }
                     else {
                                System.out.println("Invalid");
                     }
          }
class UserMainCode{
          public int vowels(String s) {
                     int isValid = o;
                     LinkedHashMap<Character, Integer> map = new LinkedHashMap<>();
                     for(int i = 0; i < s.length(); i++) {
                                char c = s.charAt(i);
                                if(c == 'a' || c == 'e' || c == 'i' || c == 'o' || c == 'u') {
                                           if(!map.containsKey(c)) {
                                                      map.put(c, 1);
```

Program 1: Write a Program to check if given word contains exactly five vowels and

the vowels are in alphabetical order. Return 1 if the condition is

```
}

}

if(map.size() == 5) {

isValid = 1;
}

return isValid;
}
```

Program 2:Employee Bonus

A Company wants to give away bonus to its employees. You have been assigned as the programmer to automate this process. You would like to showcase your skills by creating a quick prototype. The prototype consists of the following steps:

1.

Read Employee details from the User. The details would include id, DOB (date of birth) and salary in the given order. The datatype for id is integer, DOB is string and salary is integer.

2.

You decide to build two hashmaps. The first hashmap contains employee id as key and DOB as value, and the second hashmap contains same employee ids as key and salary as value.

3. If the age of the employee in the range of 25 to 30 years (inclusive), the employee should get bonus of 20% of his salary and in the range of 31 to 60 years (inclusive) should get 30% of his salary. store the result in TreeMap in which Employee ID as key and revised salary as value. Assume the age is caculated based on the date 01-09-2014. (Typecast the bonus to integer).

4.

Other Rules:

- a. If Salary is less than 5000 store -100.
- b. If the age is less than 25 or greater than 60 store -200.
- c. a takes more priority than b i.e both if a and b are true then store 100.

5.

You decide to write a function calculateRevisedSalary which takes the above hashmaps as input and returns the treemap as output. Include this function in class UserMainCode.

```
import java.text.ParseException;
import java.text.SimpleDateFormat;
import java.util.Calendar;
import java.util.HashMap;
import java.util.Map;
import java.util.Scanner;
import java.util.TreeMap;
public class Question_2 {
  public static void main(String[] args) throws ParseException{
    Scanner sc = new Scanner(System.in);
    int size = sc.nextInt();
    HashMap<Integer, String> map1 = new HashMap<>();
    HashMap<Integer, Integer> map2 = new HashMap<>();
    for(int i=0;i< size;i++){
       int id = sc.nextInt();
       String date = sc.next();
       int salary = sc.nextInt();
       map1.put(id, date);
      map2.put(id, salary);
    UserMainCode1.calculateRevisedSalary(map1, map2);
}
class UserMainCode1{
  static void calculateRevisedSalary(HashMap<Integer, String> map1, HashMap<Integer, Integer>
map2){
    DateFormat df = new SimpleDateFormat("dd-MM-yyyy");
    Calendar c = Calendar.getInstance();
    TreeMap<Integer, Integer> revisedSalaryMap = new TreeMap<>();
       c.setTime(df.parse("01-09-2014"));
    }catch(ParseException e){
       System.out.println("Invalid date format");
    for(Map.Entry<Integer, String> entry : map1.entrySet()){
       int key = entry.getKey();
       String date = entry.getValue();
       Calendar birthdate = Calendar.getInstance();
       try{
         birthdate.setTime(df.parse(date));
       }catch(ParseException e){
         System.out.println("Invalid date format");
```

```
int age = c.get(Calendar.YEAR) - birthdate.get(Calendar.YEAR);
       int salary = map2.get(key);
       if(salary < 5000){
         revisedSalaryMap.put(key, -100);
       else if(age < 25 || age > 60){}
         revisedSalaryMap.put(key, -200);
       else if(age>=25 && age<=30){
         revisedSalaryMap.put(key, (int)(salary+(salary*o.2)));
      else{
         revisedSalaryMap.put(key, (int)(salary+(salary*o.3)));
       }
    }
    for(Map.Entry<Integer, Integer> entry : revisedSalaryMap.entrySet()){
       System.out.println(entry.getKey()+" "+entry.getValue());
    }
  }
}
Program 3: Write a program that construts a hashmap and returns the value
corresponding to the largest key.
Include a class UserMainCode with a static method getMaxKeyValue which
accepts a string. The return type (String) should be the value
corresponding to the largest key.
import java.util.Collections;
import java.util.Map;
public class Largestkey {
          public static String getMaxkeyValue(Map<Integer, String> hashmap) {
                     String maxValue = (Collections.max(hashmap.values()));
                     for (Map.Entry<Integer, String> key: hashmap.entrySet()) {
                                if (key.getValue() == maxValue) {
                                          return key.getKey() + ":" + key.getValue();
                                }
                     return null;
```

}

```
import java.util.HashMap;
import java.util.Map;
import java.util.Scanner;
public class TestLargestKey {
          public static void main(String[] args) {
                     // TODO Auto-generated method stub
                     Largestkey largestkey = new Largestkey();
                     Map<Integer, String> hashmap = new HashMap<>();
                     System.out.println("Enter the size ");
                     Scanner sc = new Scanner(System.in);
                     int size = sc.nextInt();
                     System.out.println("Enter key and the value");
                     for (int i = 1; i \le size; i++) {
                                hashmap.put(sc.nextInt(), sc.next());
                     }
                     System.out.println(Largestkey.getMaxkeyValue(hashmap));
          }
}
```
